

Progress made:

We each had a component of the design document to work on throughout the week, then met on Monday for ~2.5 hours to finish and compile the document.

Each person has a part of the MVP assigned to them, and the directory is set up on Github so we can start coding. We're trying to figure out times during this week we'll all be able to meet to hack together.

Issues to discuss:

- What's the best way to split up the implementation of an API?
- After our MVP, how much should we focus on the social networking aspect?
- We're going to manually populate a database of classes; would it be easier or harder to scare them from the registrar, and do we need such completeness?
- Instead of implementing our own map, we're going to use the Google map API with a custom picture - good idea?
- We decided to move pushing changes to the map to the MVP, is this realistic?
- How much more does the final product need to have after the MVP?
