

Progress made:

We have completed developing our MVP, and although it ended up slightly different than what we had originally imagined, the MVP is still fully functional and mostly user-friendly. After some individual work, we met to work together on Monday (~5 hours) and Tuesday (~5 hours) to put together the different parts of our project. We also maintained heavy communication outside of the time when we were physically working together.

We are currently planning to meet in order to discuss how we will implement the changes to our revised design document. We will also meet before Thanksgiving break to discuss how we will assign work for the final delivery of our project.

Issues to discuss:

- How significant should the changes be for our revised design document?
- Does the revised design document require anything our original design document didn't?
- Do we need to describe the API calls in the README?
- Code for grading vs. final delivery of app
- Timeline of development for final delivery
- Additional features for final delivery app
 - Update map in real time
 - Removing classes from user
 - Turning pins on and off
 - User profile (Maybe a modal of what classes a user is taking)
 - (Other features?)
